

Mayo Clinic Minute: Importance of exercise for men with prostate cancer

VIDEO	AUDIO
Jason	Exercise is good for the body, and that holds true for men with prostate cancer.
06:11 Mitchell Humphreys, M.D. Urology Mayo Clinic	"What we found is that exercise and general health can actually have an effect not just on the tumor biology, but how some of the treatments work on that biology."
Jason	It's part of an emerging science called "physiological oncology" or "exercise oncology."
05:45 Dr. Humphreys	"They want to maximize how they're doing from a cardiovascular standpoint, which means the healthier their body is, the better they're going to do from their cancer, both before treatment, during treatment, and even after treatment."
Jason	But before men with prostate cancer begin working out and improving overall fitness, it's important to talk to a health care provider.
06:25 Dr. Humphreys	"It doesn't come down to an individual, specific exercise. A lot of these programs have to be built to the individual. There needs to be some thoughtful considerations about how they're done and how patients employ them."
Jason	And early detection of prostate cancer is key. Men in their 40s should start getting tested.
1:46 Dr. Humphreys	"Early diagnosis leads to better treatments, better prognosis and to a cure."
Jason	For the Mayo Clinic News Network, I'm Jason Howland.
